

ALARM BITS

ProcessVue Guardian 2026

What's New

ProcessVue Guardian 2026 introduces new capabilities designed to make alarm rationalization, documentation and ongoing governance easier to maintain as part of everyday engineering activities. The release strengthens the tools available to capture engineering decisions, maintain approved alarm information and communicate important changes throughout the alarm management lifecycle.

Guardian 2026 introduces new capabilities designed to strengthen alarm rationalization, improve documentation quality and make important alarm configuration changes easier to communicate across operations. New Set Action Field Rules provide greater guidance and control during the rationalization process, while the new Change Report helps organizations track recent configuration changes and communicate them more effectively to operators.

The release also introduces the Guardian Service, providing dedicated background processing for larger Guardian activities and helping teams work more efficiently at scale. Quality-of-life enhancements to template configuration and alarm response manual customization further reduce repetitive effort and give users greater flexibility over the information available to operators.

Helping make alarm rationalization, documentation and ongoing governance a more sustainable part of everyday engineering operations.

Key Highlights

These highlights provide a brief summary of the new features and functionality included in the ProcessVue Guardian 2026 release.

Set Action Field Rules	Guide reviewers through the rationalization process with configurable rules that respond to engineering decisions as they are made. Provide visual guidance, automate dependent field values and prevent incomplete or non-compliant alarm records from being submitted.
Change Report	Keep operators informed when alarm settings and limits change. The Change Report provides a clear record of recent alarm configuration changes, helping operators adapt learned responses while providing traceability of changes for audit and compliance.
Guardian Service	Support larger Guardian activities with dedicated background processing designed for scale and continuity. Tasks such as Copy to Master, Batch Edit and Copy Configuration can continue independently in the background, allowing users to keep working while progress is managed centrally.
Tab Template Copying	Reduce the time and repetitive effort involved in configuring alarm templates by copying an existing tab configuration across multiple tabs. This makes it easier to build and maintain consistent alarm configuration structures without repeatedly recreating the same fields.
Alarm Response Manual Customization	Include additional alarm configuration fields within your alarm response manual, giving you greater flexibility over the information provided to operators. This helps ensure important rationalized information, such as alarm cause, consequence and operator action, is available as part of the approved response guidance.
